Abstract of WO 0189291 (A1)

A method of cultivating bryophytes such as Sphagnum sp. and other moss species, liverwort species or hornwort species comprising the following steps: (a) obtaining a substantially pure bryophytic inoculum (5); (b) laying a length of water-impervious film (3) on a supporting substrate (4); (c) distributing the inoculum (5) on the upper surface of the film (3); (d) providing the inoculum (5) with suitable conditions of light, temperature and moisture to permit growth; and (e) harvesting the resultant vegetative mat propagated from the inoculum (5).

A METHOD OF CULTIVATION OF BRYOPHYTES

Technical Field

5 The present invention relates to a method of commercially cultivating bryophytes such as *Sphagnum* species.

Background Art

At present *Sphagnum* sp. is harvested as an in situ crop without active propagation
10 and/or cultivation. The wild moss yield is dependent upon the environmental growth conditions such as a rainfall, light intensity, humus pH and level of ground disturbance. Consequently the wild moss crop must be sustainably managed to avoid depletion of this natural resource.

15 Harvested wild moss undergoes mechanical cleaning prior to processing or packaging to remove contaminants including seeds, seedlings, invertebrates (e.g. mites) and organic debris (e.g. pollen and leaf litter deposits). Frequently, the washed crop is fumigated to obtain a sterile inert substrate for use in or as horticultural growth medium, or compressed to form a liquid retentive liner.

20

Disclosure of Invention

It is an object of the present invention to provide a method of cultivation for bryophytic plants and in particular *Sphagnum* sp. which is viable on a commercial scale, provides optimal growth conditions and yields a substantially pure monoculture.

25

The present invention provides a method of cultivating bryophytes comprising the steps of:

- (a) obtaining a substantially pure bryophytic inoculum from a wild sample;
- (b) laying a length of water-impervious film on the surface of a substrate;
- (c) distributing said inoculum on the upper surface of said film;
- (d) providing said inoculum with suitable conditions of light, temperature and moisture to
- 5 permit growth; and
- (e) harvesting the resultant vegetative mat propagated from said inoculum;

Preferably said inoculum is a manually or mechanically cleaned sample containing saprophytic and gametophytic tissue. Preferably said film is a sheet of plastic film.

10 Preferably said substrate is selected from one of the following: a quadrant of ground (e.g. an area where bryophytes naturally occur, farmland or gravel bed), or an inert medium. Optionally, said method further includes a means of controlling the level of shade cover or light intensity to enhance vegetative propagation of said inoculum.

15 Brief Description of the Drawing

By way of example only, a preferred embodiment of the present invention is described in detail with reference to the accompanying drawing in which Fig. 1 is a diagrammatic cross section of a cultivation system in accordance with the present invention.

20 Mode for Carrying Out the Invention

Referring to Fig. 1, the bryophytic cultivation system 2 essentially comprises a length of water-impervious film in the form of a plastic sheeting 3, laid over the surface of a substrate 4, upon which sheet an inoculum of bryophytic tissue 5 is dispersed by tissue scattering.

25

The inoculum 5 is a manually or mechanically cleaned sample of wild *Sphagnum sp.* Alternatively, the inoculum 5 may be derived from an axenic moss culture containing saprophytic and gametophytic tissue.

- 5 The substrate 4 is quadrant of ground in an area where wild *Sphagnum sp.* naturally occurs. The plastic sheeting 3 functions as a weed mat to prevent competitive plant germination, but periodic weeding may be necessary to maintain a substantially pure monoculture. The level of competitive plant germination from ground and airborne deposited seeds decreases as the inoculum 5 grows to form a vegetative mat
10 substantially covering the plastic sheeting 3.

- To enhance vegetative growth of the inoculum 5, the substrate 4 may be protected by a cloche or cold frame whereby the level of shade cover can be controlled by placement or removal of the or each frame cover (not shown). Alternatively, the shade cover may
15 comprise a length of shade cloth draped over and supported by a series of strained wires or clips. The inventor has noted that *Sphagnum sp.* proliferates in shaded habitats. The rate of vegetative growth can further be enhanced by monitoring and adjusting accordingly the pH and hydration level of the cultivation system 2 via a watering regime (if necessary) so that the growing moss is exposed to acidic and moist
20 conditions.

- The resultant *Sphagnum sp.* crop is harvested by removing the vegetative mat derived from the inoculum 5, from the upper surface of the plastic sheeting 3. A portion of the substantially pure crop is left to serve as the inoculum 5 for a subsequent crop.
25 Alternatively the plastic sheeting 3 with the vegetative mat are removed for processing and a new plastic sheeting is laid over the substrate 4 for the receipt of inoculum 5.

Whilst the cultivation system 2 has been described above in respect of *Sphagnum sp.*, it will be appreciated that the inoculum 5 could be any other bryophytic tissue derived from a wild moss, liverwort or hornwort species of commercial importance. Similarly, it will be appreciated that the inoculum need not be propagated and cultivated outdoors
5 but may be grown in a controlled environment wherein the substrate 4 is an inert medium.

Claims

1. A method of cultivating bryophytes including the steps of:
- 5 a) obtaining a substantially pure bryophytic inoculum;
- b) laying a length of water impervious film on a supporting substrate;
- c) distributing said inoculum on the upper surface of said film;
- 10 d) providing said inoculum with suitable conditions of light, temperature and moisture to permit growth; and
- e) harvesting the resultant vegetative mat propagated from said inoculum.
- 15 2. The method as claimed in claim 1 wherein said inoculum is a manually or mechanically cleaned sample containing saprophytic and gametophytic tissue.
3. The method as claimed in claim 1 or claim 2 wherein said film is a sheet of plastic film.
- 20 4. The method as claimed in any one of the preceding claims wherein said supporting substrate is located out of doors.
5. The method as claimed in any one of claims 1-3 wherein said supporting substrate is located indoors.
- 25 6. The method as claimed in any one of the preceding claims further including the step of providing a means of controlling the intensity of the light incident upon said inoculum.
- 30 7. The method as claimed in claim 6 wherein said means controlling the intensity of the light consists of a frame supporting removable shade cloth.
8. The method is claimed in any one of the preceding claims wherein the inoculum consists of bryophytic tissue selected from the group consisting of:
- 35

moss species, liverwort species, hornwort species.

9. The method as claimed in claim 8 wherein said inoculum is obtained from wild *Sphagnum* sp.

5

10. The method is claimed in claim 8 wherein said inoculum is obtained from an axenic moss culture.
